Frontend Coding Test

Thank you for applying to our Frontend Developer role at Shutl, an eBay company!

If you have already downloaded or cloned the repository containing the test, you will find, along this document, a .png extension file called "*front-end-test-design.png*".

This is a flat image showing the list of delivery options a seller has after the item they sold has been paid by the buyer.

We setup a React application that, currently, does not include any of the elements you see in that screen. These elements are the ones that you will have to build.

The React application, once you run npm run start, will show just like the image below.
Please, check the README.md file within the application file structure for more information on how to get the application ready for development.
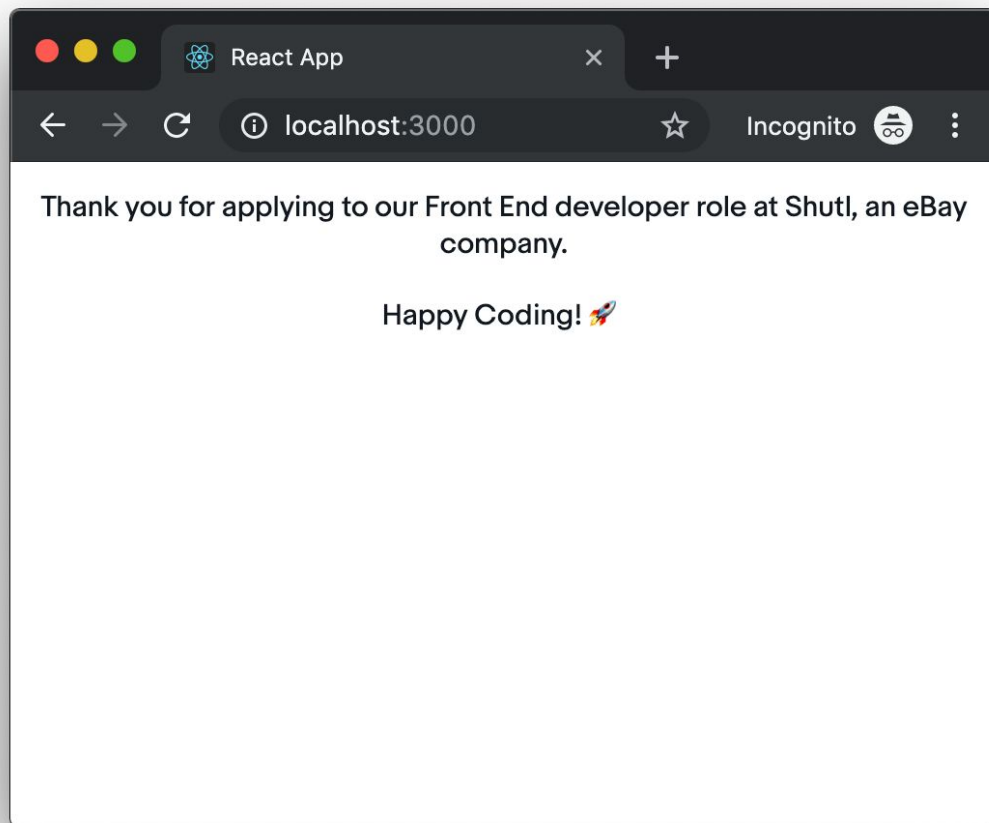

We'd like you to spend around 3 hours working in the exercise. We understand, of course, that you might not be able to complete the test 100%, but if the feedback is positive this will lead to a followup on it in a pairing exercise in our offices where you will be able to finish the exercise.

The main things we will be looking for with this exercise are:

1. Code structure
2. Semantics
3. Best practices
4. Styling approach
5. Accessibility standards
6. Documentation
7. Optimisation
8. Code Reusability

EXPECTED BEHAVIOUR

When the page is loaded we want to see the "Shutl 2-3 Days" delivery service run by myHermes to be the one selected by default.

In the bottom section, you'll see the information of this selected service and the total price for it.

When the user selects a different service, the bottom section will be updated with the new service selected. And that's it! :)

The different texts that you see in blue are meant to be external links, so feel free to add a fake url.

DESIGN ASSETS & STYLE GUIDE

You'll find the eBay logo in svg format in the assets folder and a png file for the bottle image.

As you'll notice when running the app for the first time, some css styling is already present on the app. We have added, for your commodity, the cdn link to the official eBay Css framework in the html file that renders your react app. You can find all the information and style guide here https://ebay.github.io/skin/ds6/index.html

If you'd rather import the npm package, feel free to do so. We added the cdn just to speed up development.

Although the design we provided you does not contain the eBay typography (Market Sans), the css framework does, so this is what you'll see instead of Helvetica. With this in mind, don't worry if your final looks is not *exactly* like in the png file.

When you're done:
- Create a new dev-README.md file in the project explaining your development choices when working on the exercise, any problems you found, or anything you'd like us to know.
- Send us your code via Github or zip, so that we can review your work. We'll let you know when we clone or download it so you can either delete it from your Github account or set it to private.

Good luck! – Shutl Team
